## Executive Summary

A digital database of 100 aerial images was created to document the marine ecosystems of Koutavos Lagoon and the adjacent bay in Kefalonia Island, using UAS technology. Flights were optimized to minimize disturbance to sea turtles and maximize image quality, capturing key ecological data. Detailed records, including animal sightings and environmental conditions, were collected to support ongoing monitoring and research efforts.

## The GUV imagery dataset

A digital databased was compiled consisting of 100 images from the marine ecosystems of Koutavos, Kefalonia island. All flights were planned and carried out using Unmanned Aerial Systems (UAS). The flights covered the entire area of the Koutavos Lagoon, as well as the part of the bay that directly connects to it and extends up to the port of Argostoli, as these areas were identified as meeting all the necessary criteria for the implementation of the action:

- (a) intense use by sea turtles, and
- (b) significant anthropogenic pressures.

The DJI Air 2S model was used for the flights. The flight plans were created with the help of the Dronelink software. The flight altitude was set at 70 meters, determined after trial flights, allowing for the identification of turtles and the coverage of the necessary study area within a time frame that was energy-efficient with respect to flight autonomy criteria. It is important to note that at this altitude, auditory or visual disturbance to the turtles is avoided.

The interval between successive photo captures was set at five seconds, with the camera positioned vertically above the water surface, and the photos having a minimum overlap of 10%. The optimal time of day for conducting flights was observed to be shortly after sunrise, successfully avoiding haze in parts of the photos under ideal weather conditions. In cases where water glare was intense due to atmospheric cloud cover, the flight time was adjusted accordingly. Similarly, flights were conducted during the afternoon hours or postponed when heavy rainfall or strong winds prevailed at the scheduled flight time.

For each flight the following information was collected and became available: date / time / duration / weather conditions / number of animals identified / sex of individuals / age class of individuals.

Bellow a summary of the data:
